

% of young (22–25) cohort employment rate at October 2022

# Differential young-cohort employment by AI exposure continuous-exposure event study, per-capita rate (linear OLS)

Sample: private-sector foretak (sekt = 3), 22–55-year-olds, 2021m1–2025m7. Specification:  $\text{reghdfe rate} = \text{count} / N(\text{age, month})$  on  $i.k \times \text{young} \times \text{exposure\_std}$ , absorbing  $\text{foretak} \times \text{age} + \text{foretak} \times \text{month} + \text{age} \times \text{month}$ , weighted by SSB cohort population, clustered at foretak. Young = ages 22–25; exposure\_std = standardized Eloundou GPT-4  $\beta$ . Event time  $k$  aggregated to 2-month bins ( $k = -1, 1, 3, \dots, 31$ ), labelled by the last calendar month of the bin. Reference: October 2022 (omitted). Dashed red line: November 2022 (GPT-4 era). Tick marks at January of each year. Shaded band: 95 % CI. Coefficient = differential employment-rate change at event time  $k$  for young workers per SD of exposure, divided by the young (22–25) cohort employment rate at October 2022, times 100 (% of young baseline). Source: from\_secure\_server/coefficients/coef\_event\_study\_continuous\_share.csv + baseline\_kref\_by\_age.csv.
