

Employment by AI-exposure quintile vs. Q1, by age cohort
firm-FE event study, Poisson

Log-points x 100 (~ % change vs Q1, k = -1 reference)

Sample: private-sector foretak (sekt = 3), 22–55-year-olds, 2021m1–2025m7. Specification: $\text{fepois}(\text{count_all} \sim i(k, \text{ai_q}, \text{ref} = -1, \text{ref2} = 1) \mid \text{foretak}^q + \text{foretak}^{\text{month}})$, clustered at foretak, estimated separately per age bin. Reference: October 2022 ($k = -1$) and Q1. Dashed red line: November 2022 (GPT-4 era). Tick marks at January of each year. Shaded band: 95 % CI. Y-axis: $\gamma_{\{q,k\}}$ (log-points) x 100, approximately percent change in q employment relative to Q1 from the reference month to event time k. All panels share the y-axis (Poisson log-points are directly comparable across ages and quintiles). Source: from_secure_server/coefficients/coef_event_study_fepois.csv.
