

Employment of Q5 (most AI-exposed) occupations vs. Q1, by age cohort firm-FE event study, Poisson

Sample: private-sector foretak (sekt = 3), 22–55-year-olds, 2021m1–2025m7. Specification: $\text{fepois}(\text{count_all} \sim i(k, \text{ai_q}, \text{ref} = -1, \text{ref2} = 1) \mid \text{foretak}^q + \text{foretak}^{\text{month}})$, clustered at foretak, estimated separately per age bin. Reference: $k = -1$ (October 2022) and $q = 1$ (least exposed). Dashed red line: November 2022 (GPT-4 era). Tick marks at January of each year. Shaded band: 95 % CI. Poisson log-point coefficients $\gamma_{\{Q5,k\}}$ multiplied by 100 read approximately as percent change in Q5 employment relative to Q1 employment, at event time k vs the omitted reference month.
