

Full model, INT = corner p75 × p75 (nyjobb); re-anchored Apr 2025 = agentic

Interaction term (green, bold) defined as corner p75 × p75; shown alongside the free linear exposure and ln wage gradients. Private sector, Poisson PPML, occ + month FE; SE clustered at occupation. Model:  $z(\text{exp})$ ,  $z(\ln \text{FTE wage})$  and one interaction term, each × event-time ( $k=-1$  ref). All paths are  $\Delta \log$  hires per 1 SD of the construct. Dashed grey = reference launch.
