

Full model, INT = corner p80 × p80 (nyjobb); re-anchored Apr 2025 = agentic

Interaction term (green, bold) defined as corner p80 × p80; shown alongside the free linear exposure and in-wage gradients. Private sector, Poisson PPML, occ + month FE; SE clustered at occupation. Model: $z(\text{exp})$, $z(\ln \text{ FTE wage})$ and one interaction term, each × event-time ($k=-1$ ref). All paths are $\Delta \log$ hires per 1 SD of the construct. Dashed grey = reference launch.
